¹) Refer to the data sheet for the bearing bracket used.
1.3 Dismantling the shaft seal

- Dismantle the pump as described in operating manual 1311.8.
- The back pull-out unit has been placed in a clean and level assembly area.
  1. Pull off the rotating assembly of mechanical seal 433.01.
  2. Undo nuts 920.02 at seal cover 471. Slide the seal cover against the bearing bracket.
  3. Undo nuts 920.15 (if any) at casing cover 161.
  4. **On variants with a clamped casing cover:** Undo and remove transport locks 901.98. Remove casing cover 161 from bearing bracket 330.
  5. **For variants with a bolted casing cover:** Use forcing screws 901.31 to remove casing cover 161 from bearing bracket 330.
  6. Pull shaft sleeve 523 with the rotating assembly of mechanical seal 433.02 off shaft 210.
  8. Remove intermediate ring 509 with the stationary assembly (mating ring) of mechanical seal 433.01 from casing cover 161.
  9. Remove the stationary assembly (mating ring) of mechanical seal 433.01 and O-rings 412.15 from intermediate ring 509.
  10. Remove the stationary assembly (mating ring) of mechanical seal 433.02 from seal cover 471.
  11. Remove the rotating assembly of mechanical seal 433.02 with the thrust ring from shaft sleeve 523.
  12. Remove and dispose of gasket 400.75.

1.4 Fitting the shaft seal

The following rules must be observed when installing the mechanical seal:
- Work cleanly and accurately.
- Only remove the protective wrapping of the contact faces immediately before installation takes place.
- Prevent any damage to the sealing surfaces or O-rings.
  - Observe / carry out the notes and steps given in operating manual 1311.8.
- The bearing assembly as well as the individual parts are kept in a clean and level assembly area.
- All dismantled parts have been cleaned and checked for wear.
- Any damaged or worn parts have been replaced by original spare parts.
- The sealing surfaces have been cleaned.
  1. Clean shaft sleeve 523, and touch up any score marks or scratches with a polishing cloth, if necessary. If score marks or scratches are still visible, fit new shaft sleeve 523.

**NOTE**

To reduce friction forces when assembling the seal, wet the shaft sleeve and the location of the stationary ring with water.

2. Fit the rotating assembly of mechanical seal 433.02 with the supplied thrust ring on shaft sleeve 523.

**CAUTION**

Elastomers in contact with oil/grease

Shaft seal failure!
- Use water as assembly lubricant.
- Never use oil or grease as assembly lubricant.
3. Carefully position the stationary assembly (mating ring) of mechanical seal 433.02 with the O-ring in seal cover 471. Make sure to apply pressure evenly.

4. Slide seal cover 471 onto shaft 210 until it rests against bearing bracket 330.

5. Carefully position the stationary assembly (mating ring) of mechanical seal 433.01 with the O-ring in intermediate ring 509. Make sure to apply pressure evenly.

6. Insert O-rings 412.15 in intermediate ring 509.

7. Fit intermediate ring 509 with O-rings 412.15 and the stationary assembly of mechanical seal 433.01 in the casing cover.

8. Slide shaft sleeve 523 together with the rotating assembly and new gasket 400.75 onto shaft 210.

9. **On variants with a bolted casing cover:** Screw back but do not remove forcing screws 901.31. Slide casing cover 161 with intermediate ring 509 onto bearing bracket 330. While doing so, gently slide seal cover 471 into casing cover 161.

10. Fit and tighten nuts 920.15 at casing cover 161.

11. **On variants with a clamped casing cover:** Slide casing cover 161 with intermediate ring 509 onto bearing bracket 330. While doing so, gently slide seal cover 471 into casing cover 161. Insert screws 901.98 (transport lock) into bearing bracket 331 and tighten them to fasten the casing cover.

12. Fit and tighten nuts 920.02 at seal cover 471.

13. Slide the rotating assembly of mechanical seal 433.01 onto shaft sleeve 523.

14. Carry out all other relevant steps given in operating manual 1311.8.

### 1.5 Quench liquid

#### 1.5.1 Applications

A quench liquid is used in the following cases:

- Where a single mechanical seal without supportive measures would not work at all or unsatisfactorily.
- Where a double mechanical seal design with pressurised barrier fluid is not required.

#### 1.5.2 Quench system arrangement

![Quench pot arrangement](image)

<td>DN 8</td>
</tr>
</tbody>
</table>

Quench liquid from quench pot arranged above the seal: liquid circulated by means of thermosyphon effect or forced circulation.

1.5.3 Quench liquid requirements

The quench liquid should preferably form a solution with the fluid handled and be environmentally compatible.

**Typical quench liquids**

- Water with a conductivity of 100 - 800 µS/cm
- Water/glycol mixture
- Glycerine

The quench liquid should be supplied to the mechanical seals unpressurised (at atmospheric pressure), if possible. Positive pressures of up to 0.5 bar are acceptable. The one-way quench supply should be adjusted to a constant flow ≥ 0.4 l/min. Periodically check the quench liquid for contamination (replace quench liquid and clean quench system if necessary).

---

2) Closed for transport
3) Make sure the circulation line diameter is ≥ ¼".
